1. Was ist ASTO-BOT?

ASTO-BOT is a complete Twitch streaming tool for Windows. It connects directly to Twitch, OBS Studio, and various AI services, allowing you to automatically react to events in your stream — no programming knowledge required.

With ASTO-BOT you can, among other things:

- Automatically react to follows, subscriptions, bits, raids, channel point redemptions, and much more
- Send AI-generated chat responses with a custom personality
- Control OBS scenes and sources via events or scripts
- Create custom overlay animations and integrate them directly into OBS
- Record, save, and automatically play clips
- Run a points and giveaway system for your community
- Write custom automations using the built-in scripting language ASTOSCRIPT

ASTO-BOT runs entirely locally on your PC. All sensitive data such as tokens and passwords are stored encrypted and never leave your computer.

2. Installation & Erster Start

2.1 Installation

ASTO-BOT does not require installation in the traditional sense. Simply run the provided EXE file.

- Lege die EXE-Datei in einen eigenen Ordner, z.B.: C:\Streaming\ASTO-BOT\
- Launch the EXE with a double-click
- On the first start, all required subfolders are created automatically

⚠ Note: Never move the EXE without also moving the associated folders Config, Sounds, Overlays, and Prompts. These folders must always be in the same directory as the EXE.

2.2 System Requirements

- Windows 10 or Windows 11 (64-bit)
- Internet connection (for Twitch authentication and AI features)
- OBS Studio 28 or newer (optional, for overlay and scene control)

2.3 The Dashboard on First Start

After the first start you will see the Dashboard. In the top-left "Connections" area you can see the connection status for all services. Initially, the Streamer, Bot, and other services are not yet connected.

The ASTO-BOT Dashboard — overview of all important information at a glance

The small Connections area in the top-left always shows the current connection status:

Green = connected, Red/Grey = not connected

3. Einrichtung

All configuration is done in the Settings area, which you can access via the button in the top-right corner. The settings are divided into several tabs.

3.1 AI Settings (Settings → AI)

Here you enter your API key for the AI service and configure the personality of your bot.

Before — empty settings

AI settings with API key and configuration entered

The most important fields at a glance:

- **API Key:** Your personal key for Gemini (Google) or ChatGPT (OpenAI). You can obtain the key from the respective provider's website.
- **AI Provider:** Leave on "auto" — ASTO-BOT automatically detects whether it is a Gemini or ChatGPT key.
- **Persona Style:** The personality of your bot. Example: "friendly, funny, always helpful, loves video games". This text is included with every AI request.
- **Bot Name:** The name of your bot, e.g. GandalfBott.
- **Streamer Name:** Your Twitch name.
- **Response Length:** How long the AI responses should be. 500 is a good starting value.

💡 Tip: After entering your details, click the Test button to check whether the connection is working.

3.2 Twitch Connection (Settings → Twitch)

Here you connect ASTO-BOT to your Twitch account. You need two accounts: your streamer account and a bot account (which writes in chat).

Before — not connected

The screenshot shows the 'Settings' sidebar on the left with 'Twitch' selected. The main panel is titled 'Twitch Settings' and contains the following elements:

- Ignore List:** A text input field with the placeholder '(Comma-separated: bot1,bot2)'.
- Resume Window (min):** A numeric input field set to '10', with a tooltip: 'If stream goes offline and comes back within this many minutes, %IsResumedStream%'.
- Greeting Cooldown (h):** A numeric input field set to '24', with a tooltip: 'Hours before the same viewer gets greeted again'.
- Reset Greetings:** A button with a circular arrow icon.
- Account Connection:** A section with the instruction: 'Click Connect — you will be redirected to Twitch. Login is handled securely via the ASTO-BOT Server.'
- Streamer:** Labeled 'Not connected' in red text, with 'Connect' and 'Logout' buttons.
- Bot:** Labeled 'Not connected' in red text, with 'Connect' and 'Logout' buttons.

Twitch settings — no account connected yet

After — connected

This screenshot shows the same 'Twitch Settings' panel as above, but with the following changes:

- Streamer:** Labeled 'Connected ✓' in green text, with 'Connect' and 'Logout' buttons.
- Bot:** Labeled 'Connected ✓' in green text, with 'Connect' and 'Logout' buttons.

Both accounts successfully connected — green checkmark

Click the Connect button next to "Streamer" and log in with your streamer account. Repeat this for the "Bot" account.

Additional settings on this page:

- Ignore List: Bots or users that should be ignored for events, e.g. "streamelements,nightbot".
 - Resume Window: If your stream restarts within this number of minutes, it is treated as a continuation and does not trigger a new stream start event.
 - Greeting Cooldown: How many hours must pass before a viewer is greeted again.
 - Reset Greetings: Resets all greeting cooldowns.
-

3.3 OBS Connection (Settings → OBS)

ASTO-BOT connects to OBS Studio via the OBS WebSocket protocol. First enable the WebSocket feature in OBS under Tools → WebSocket Server Settings.

Before — empty

OBS settings — no connection configured yet

After — configured

OBS fully connected and configured

The most important fields:

- **WebSocket URL:** Default is ws://127.0.0.1:4455 — only change this if you have set a different port in OBS.
- **Password:** The WebSocket password you set in OBS.
- **HTML Overlay:** Here you configure which OBS scene and browser source are used for the ASTO-BOT overlay.
- **Window Capture Overlay:** For the window capture variant of the overlay.
- **Photo Mode:** Scene and source for Photo Mode.

💡 **Tip:** Click the Test button to check whether OBS is reachable.

3.4 Backup & Restore

In Settings you will find the backup function in the bottom-left. With a single click on Backup, an archive of all configuration files is immediately created. With Load Backup you can restore a previous state.

Create and load backup

4. Events — Automatically Reacting on Twitch

Events are the heart of ASTO-BOT. An event is a combination of a trigger and one or more actions. For example, when someone follows your channel, ASTO-BOT can automatically send an AI-generated response to chat.

4.1 The Events Overview

A new event — without actions yet. On the left the event list, on the right the trigger settings.

On the left you can see all your events in groups. In the top-right you can set the name and ID of the event and choose which Channel Points-Reward, Chat Command, Twitch trigger, or OBS trigger fires the event.

4.2 A Fully Configured Event

A fully configured follow event with multiple actions

In this example, ASTO-BOT reacts to every new follower with multiple simultaneous actions: show overlay, play sound, send an AI message to chat, and then hide the overlay again.

4.3 Triggers — Who Fires the Event?

On the right side, under "Trigger", you select what should fire the event. Possible triggers:

- Twitch: Follow, New Sub, Resub, Gift Sub, Gift Bomb, Bits, Raid, Shoutout, Hype Train, Stream Start, Stream Offline, Ban, Poll, Prediction, and many more
- OBS: Scene change, Stream Start, Stream End, Recording Start/End
- Channel Points-Reward
- Chat Command: A specific chat command such as !so
- Word Trigger: React when a specific word appears in chat. If * is used, every word is matched; capitalization is ignored.
- Timed: Event repeats automatically at a configurable interval

Tip: An event can have multiple triggers at the same time. Simply enable all desired toggles on the right side.

4.4 Actions — What Should Happen?

Click "+ Action" to add a new action. The Action Picker will open:

The Action Picker with all available actions

Available action categories:

- Chat: AI-generated message (Chat AI) or fixed text (Chat Fixed) or Text-to-Speech
- Sound: Play sound, play sound from folder, stop all sounds
- OBS: Show/hide sources, switch scene, set GDI text, set browser URL
- Twitch: Timeout, Ban, VIP, Mod, Shoutout, Create Clip, Refund Channel Points
- Variables: Set variables, random number, award/remove points
- Flow: Delay, IF/ELSE condition, random chance, run script, trigger event
- Clips: Clip Player, Clip List Player, Create Clip
- System: Set Variable, Run Event, Run Script, Delay, Write to File, Read from File, HTTP Request, Launch Programm, Play Overlay, WebSocket Send

4.5 IF/ELSE — Conditions

IF/ELSE with variable selection and comparison operators

In the left field you select a variable (e.g. %UserName% or %IsSubscriber%). In the middle you choose the comparison (equals, not equals, contains, greater than, etc.). In the right field you enter the comparison value.

In the green THEN area you add the actions that run when the condition is true. In the red ELSE area you add the actions for the opposite case.

Note: Only one IF/ELSE can be placed at the top level per event. However, one additional IF/ELSE can be nested inside each THEN and ELSE area.

4.6 Chance — Random Probability

Chance action with adjustable probability in percent

The Chance element lets you define the probability of something happening. The slider sets the chance in percent. In the YES area (e.g. 30%) you add what happens on success; in the NO area, what happens on failure.

4.7 Channel Points-Belohnung

ASTO-BOT can manage Twitch Channel Points-Rewards directly and link them to events. Click the Reward button (gift icon) in the top-right of an event.

Reward management: create, edit, and link rewards to events

Here you can see all your Twitch rewards. You can:

- Create new rewards directly in ASTO-BOT (+ New Reward)
- Link existing rewards to an event (Link button)
- Edit name, description, cost, color, and cooldowns

Note: Rewards MUST be created through ASTO-BOT. Rewards created directly on Twitch cannot be refunded (Channel Points Refund only works with ASTO-BOT rewards).

4.8 AI Prompt — Giving the Bot a Personality

When you use the "Chat (AI)" action, ASTO-BOT sends a prompt to the AI. You can customize this prompt individually for each event.

The AI prompt for an event with available variables to insert

Click on a variable in the bottom of the prompt area to copy it instantly. Good prompts include:

- Who the bot is (%BotName%, %PersonaStyle%)
- Who triggered the event (%UserName%)
- What happened (e.g. "just subscribed to your channel")
- How long the response should be (e.g. "Maximum 200 characters. No emojis.")

Example Prompts

Greeting (Follow):

```
You are %BotName%, a friendly Twitch chat bot with personality: %PersonaStyle%
The viewer %UserName% just followed your channel. Greet them warmly, mention
their name, and thank them for the follow. Maximum 200 characters. No emojis.
```

Bits Donation:

```
You are %BotName%, a grateful Twitch chat bot with personality: %PersonaStyle%
%BitSpender% just donated %BitAnzahl% bits: %BitNachricht% Thank them warmly,
mention the number of bits, and respond to the message. Maximum 200 characters.
No emojis.
```

Resub (Subscription renewed):

```
You are %BotName%, an enthusiastic Twitch chat bot with personality:
%PersonaStyle% %UserName% has renewed their %SubTier% subscription. Thank them
for their loyalty and mention their name. Maximum 200 characters. No emojis.
```

Hype Train:

```
You are %BotName%, with personality: %PersonaStyle% The Hype Train on
%StreamerName%'s channel has reached level %Level%! Progress: %Progress% of
%Goal% points. Hype up the community! Maximum 200 characters. No emojis.
```

5. Commands — Setting Up Chat Commands

In the Commands area you can create chat commands that viewers can type in your chat, e.g. !so, !lurk, or !watchtime.

The command overview with all configured chat commands

Each command shows at a glance:

- Command: The command that viewers type (e.g. !clip)
- Permission: Who can use the command (Everyone, Mod, VIP, Streamer)
- Global CD: Global cooldown in seconds — how long everyone must wait after one use
- User CD: User-specific cooldown — how long an individual viewer must wait
- Only User: If enabled, the bot only replies to the user who entered the command
- Active toggle: Quickly enable or disable the command

Commands can be organized into groups. Click "+ Add Group" to create a new group, and "+ Add Command" to add a new command.

 Tip: Commands are linked to Events, Giveaway, Photo Mode, and Clip Player. First create the command here, then select it in the desired event under "Chat Command".

6. Scripts & ASTOSCRIPT

Scripts are automations that you write yourself in the built-in scripting language ASTOSCRIPT. They enable complex workflows that would not be possible with the standard event builder — e.g. loops, calculations, conditions that react to variables.

Note: Scripts do not run on their own. They must always be started via an event — either through the "Run Script" action in an event, or directly via the Run button for testing.

6.1 Creating a Script

Empty script editor — to create a script, first enter the name in the bottom-left and press the green + button

How to create a new script:

- Enter the desired name in the "Script name" field in the bottom-left
- Click the green + symbol
- The new script appears in the left list and the editor opens
- Write your code in the editor

A completed script with ASTOSCRIPt code

The buttons in the top-right of the editor:

- Vars: Shows all currently stored variables of the script
- Debug: Runs the script in dry-run mode — no real actions, but errors are shown
- Delete: Deletes the script (moved to trash)
- Run: Executes the script immediately — useful for testing
- Tutorial: Opens the ASTOSCRIPt tutorial in a separate window

6.2 The ASTOScript Tutorial

The ASTOScript Tutorial & Library — here you find all commands with examples

The tutorial opens as a separate window and can stay open while you write. It contains:

- All available commands with explanations
- Ready-made code examples that you can copy with a click or load directly as a new script
- A search function to quickly find the right command

The "Copy AI Prompt" button at the top of the tutorial window copies a complete prompt containing all ASTOScript commands. You can paste this directly into an AI like Claude, Gemini, or ChatGPT to have it write a script for you.

6.3 Variable Reference

The variable window — click on a variable to copy it instantly

The variable window (accessible via the Vars button) shows all available built-in variables. Click on a variable to copy it to the clipboard.

6.4 ASTOScript Basics

ASTOScript is a simple scripting language. Each line is a command. The bot reads from top to bottom:

```
| # This is a comment CHAT "Hello Chat!" WAIT 3 CHAT "Three seconds later..."
```

The most important commands at a glance:

- CHAT "Text" — Sends a message to the Twitch chat
- WAIT 5 — Waits 5 seconds (WAIT 500 MS for milliseconds)
- LOG "Text" — Writes to the ASTO-BOT log (invisible to viewers, useful for debugging)
- OBS SCENE "SceneName" — Switches the OBS scene
- SOUND "file.mp3" VOLUME 80 — Plays a sound
- SOUND STOP — Stops the current sound immediately
- POINTS ADD %UserName% 50 — Gives the viewer 50 points
- STOP — Immediately terminates the script

Variables:

```
# Create your own variable: SET $points = 100 SET $name = %UserName% CHAT $name  
+ " has " + $points + " points!"
```

IF/ELSE — Decisions:

```
IF %IsSubscriber% == "true"      CHAT "Thanks for your sub, " + %UserName% + "!"  
ELSE      CHAT "Hello " + %UserName% + "!" END
```

WHILE — Loops with timer function:

```
SET $time = 0 WHILE $time < 30 AND %OBSScene% == "Intro"      WAIT 1      SET  
$time = $time + 1 END SOUND STOP
```

Technical details: WHILE loops check the condition before each iteration. %OBSScene% is read live from OBS on every iteration — allowing the loop to react to manual scene changes. Maximum 100,000 iterations per loop.

7. Clips

The Clips area offers two functions: the classic Clip Player for Twitch clips from a specific streamer, and the Clip List Player for self-managed lists with multiple streamers. The stop button immediately halts any clip and hides the OBS source the clip is playing in.

The Clips tab with clip list, preview, and playlist

7.1 Clip Player Action

The Clip Player action in the event builder — searches for clips from a specific streamer

This action automatically searches for a clip from the specified streamer on Twitch and plays it via an OBS browser source. In the YES area (clip found) you can add further actions; in the NO area you define what happens if no clip is found.

7.2 Clip List Player Action & Clip List Manager

The Clip List Player action plays clips from a self-managed list. The list is saved as a JSON file and can be edited via the Clip List Manager.

Clip List Player with the Clip List Manager open

In the Clip List Manager you can:

- Create new lists (+ Create)
- Add clips via the Twitch URL — ASTO-BOT automatically fetches title, duration, and streamer info
- Edit clip labels — the label is the term viewers use to call up the clip via chat command
- Delete clips (🗑 icon)
- Change the folder where lists are saved

Clip search works in this order: 1. Number (e.g. "3"), 2. Exact label (e.g. "bugs halt"), 3. Partial text in the title. Capitalization is ignored.

💡 Tip: The Clip List Manager is also available in the Create Clip action — so you can save newly created clips directly to the desired list.

7.3 Create Clip Action

Create Clip action — creates a Twitch clip with optional saving to the list

This action automatically creates a Twitch clip during the stream. The "Save to list" toggle lets you specify that the clip is saved directly to a list. The label is populated from the specified variable (e.g. %UserInput% when a viewer calls the command with a name).

After creation, the following variables are available: %ClipId%, %ClipTitle%, %ClipEmbedUrl%, %ClipCreated%, %ClipNumber%, %ClipLabel%.

Note: Clip creation requires an active live stream. Immediately after stream start (less than 30 seconds), the Twitch API cannot yet create a clip.

7.4 Get Target Info Action

Get Target Info — fetches detailed information about a Twitch user

This very useful action fetches detailed information about any Twitch user and stores it in variables. Enter a username or a variable such as %UserName% or %UserInput% in the Target field.

Available variables afterwards: %targetUser%, %targetChannelTitle%, %game%, %targetIsAffiliate%, %targetIsSubscribed%, %accountAge%, %recentGames%, and many more. For example, during a shoutout you can automatically mention which game the streamer last played.

8. Overlay Editor

The Overlay Editor lets you create custom animated overlays that are displayed directly in OBS. Each overlay consists of elements (images, texts) with animated steps.

The Overlay Editor with canvas and properties panel

8.1 Basic Principle

An overlay element has multiple steps — for example: Fade In, Wait, Fade Out. Each step has an animation effect (Slide Up, Slide Left, Wait, Return to Start, etc.) and a duration.

Drag & Drop image here

Preview

▶ Play Step #1

The properties of an element with animation, color, and trigger

Important notes for the Overlay Editor:

- **Timestamps/Steps:** To see the timestamps of the steps, the element must be selected in the editor. Use the Step button (+ Step) to add more steps.
- **Pin function:** Press the Pin button at the bottom (must be green) to save the starting position. The "Return to Start" effect always jumps back to this saved position — even without a loop.
- **Preview:** The Preview button displays the element directly without needing to trigger an event — perfect for testing.
- **Text with variables:** Text elements can contain variables (e.g. %UserName%, %CheerAmount%). These are automatically filled in at runtime.

8.1.1 Sound per Step

Each step can play its own sound. In the properties panel, under the "Sound" section, you will find a file picker and a volume slider (0–100%). Select an audio file and set the desired volume.

The **Wait for finish** toggle controls what happens after the step: when enabled, the overlay waits until the sound has finished playing before moving to the next step. When disabled, the next step starts immediately after the set animation duration — the sound continues playing in the background.

 **Tip:** With "Wait for finish" you can, for example, play a jingle and only then show the next element — the animations wait for the sound, not the other way around.

8.1.2 Multiple Timelines (Trigger Image)

In the properties panel of an element, there is a **Trigger** section at the bottom with a "Drop Image" field. When you drag and drop an image there, a **new timeline** is automatically created for this image and shown as an additional row in the step bar.

In the canvas the new timeline is always visible and can be freely positioned. During live operation, however, it only appears when it is its turn. The steps play sequentially.

To edit the steps of a secondary timeline, click the associated main image in the canvas. The steps of that timeline will then be shown in the editor and can be edited.

 **Tip:** This way you can build complex sequences — e.g. first show a banner, then automatically start a second element with its own sound and animation after it finishes.

8.2 Monitor Selection

Monitor selection for the overlay — only visible when OBS Window Capture is active

The "OBS Window Capture" toggle at the top of the Overlay Editor lets you specify whether the overlay is shown on the monitor. This option is only available when you are using the window capture method.

8.3 OBS Setup for the Overlay

There are two methods for displaying the overlay in OBS:

Method 1: Browser Source (HTML Overlay)

OBS browser source for the ASTO-BOT overlay — URL is set automatically

Create a new browser source in OBS. The URL is automatically set by ASTO-BOT (<http://127.0.0.1:2520/overlay/...>). This method works even without a visible ASTO-BOT window.

Method 2: Window Capture

OBS window capture for the ASTO-BOT overlay

Create a window capture source in OBS. Important settings:

- Window: [python.exe]: ASTO Overlay (not ASTO-BOT 1.0!)
- Capture method: Windows 10 (1903 and above)
- Match priority: Window title must match

Same settings for Photo Mode, but with Window: ASTO Photo Mode

9. Giveaway & Points System

The giveaway system with points table and active raffles

9.1 The Points System

ASTO-BOT has its own points system independent of Twitch Channel Points. Viewers automatically accumulate points while watching your stream.

- Points name: Choose a custom name (e.g. "Coins", "Crystals", "Gold Pieces")
- Rate per minute: How many points viewers receive per minute
- Followers only: Enable this toggle if only followers should earn points

In the "Manage Points" area you can manually award or remove points, or set a user's balance to a specific value.

Points can also be distributed via Events, Commands, and Scripts:

- Events/Commands: Use the "Points Add/Remove" action
- Scripts: Use POINTS ADD %UserName% 50 in ASTOSCRIPT

9.2 Giveaways

You can have any number of giveaways active simultaneously. All use the same points system.

- + Add Giveaway: Creates a new giveaway
- Linked Command: Link a chat command — viewers type the command to enter
- Max Coins: Maximum entry cost per participation (0 = unlimited)
- Active Toggle: Enable or disable the giveaway
- Draw: Picks a random winner from all participants
- Finish: Ends the giveaway
- Reset: Removes all participants and starts fresh

10. Photo Mode

Photo Mode lets you host interactive photo sessions with your viewers. Viewers can join the shot via chat command.

Photo Mode with backgrounds, canvas preview, and chat command assignments

10.1 Photo Mode Layout

The canvas shows three default areas:

- **Streamer Photo (green):** The area for the streamer's Twitch profile picture. Profile pictures of other streamers can also be included — not just your own.
- **Viewer Photo (orange):** The area for the Twitch profile pictures of viewers who join via chat command.
- **Shot Preview (blue):** Here the finished photo is displayed after the shot is taken

The "+ Text" button lets you add additional text fields that are visible in the overlay.

10.2 Control Bar

The Photo Mode control bar at the top of the tab

The buttons from left to right:

- **Snap:** Triggers the shot. The timer (0, 3, 5, or 10 seconds) then counts down.
- **Select:** Selects the photo and displays it in the Shot Preview
- **Skip:** Skips the current photo but it is still saved
- **Finish:** Ends the photo session
- **Timer:** Countdown duration before the shot (0 = immediately)

10.3 Backgrounds

Background selection in the left sidebar

In the top-left you select the background for the photo session. Use "Prev" and "Next" to browse through backgrounds. Use "+ Add" to add new images. The chat commands are linked to the respective Photo Mode functions — create them first in the Commands area.

10.4 OBS Setup for Photo Mode

Create a window capture source in OBS with the following settings:

- Window: [python.exe]: ASTO Photo Mode
- Capture method: Windows 10 (1903 and above)
- Match priority: Window title must match
- Client area: Enable

OBS window capture settings for Photo Mode

11. Websocket-Integration

External tools such as the Elgato Stream Deck can control ASTO-BOT via the WebSocket interface. Enable the feature in Settings → WebSocket.

Settings

- AI
- Twitch
- OBS
- SpeakerBot
- Sounds
- Websocket**
- System Check
- Queues
- Variables
- Import / Export
- About

Websocket Integration

Allow external tools (e.g. Stream Deck, custom scripts) to trigger events and scripts via a local websocket.

☒ Websocket active

Host: 127.0.0.1 (local only — not exposed to the network)

Port: 2519 (default 2519 — change if another tool uses this port)

[Test Connection](#) [Copy Example](#) ☒ Active on ws://127.0.0.1:2519

How it works

Connect any tool to `ws://127.0.0.1:<port>` and send JSON messages. Click any command to copy it to clipboard.

Run a script:	<code>{"script": "my_script_name"}</code>
Trigger an event:	<code>{"event": "greeting"}</code>
Event with input:	<code>{"event": "shoutout", "input": "username"}</code>
Clip playlist start:	<code>{"playlist": "start"}</code>
Clip playlist stop:	<code>{"playlist": "stop"}</code>
Ping:	<code>{"ping": true}</code>
— Overlay —	
Play overlay:	<code>{"overlay": "overlay_name"}</code>
— Photo Mode —	
Start photo mode:	<code>{"photo": "start", "user": "username"}</code>
Stop photo mode:	<code>{"photo": "stop"}</code>
Join photo:	<code>{"photo": "join", "user": "username"}</code>
Next background:	<code>{"photo": "next_bg"}</code>
Prev background:	<code>{"photo": "prev_bg"}</code>
Snap photo:	<code>{"photo": "snap"}</code>
Stop timer:	<code>{"photo": "timer_stop"}</code>
Select photo:	<code>{"photo": "select"}</code>
Skip photo:	<code>{"photo": "skip"}</code>
Finish photo mode:	<code>{"photo": "finish"}</code>

- Events are triggered by their SIGNAL/EVENT NAME — not the trigger string.
- Events without a trigger still work fine.
- Runs independently of the External mode — both can be active at the same time.

WebSocket settings with all available commands

ASTO-BOT listens on port 2519 by default (local only, not visible on the network). Connect your tool to `ws://127.0.0.1:2519` and send JSON messages.

11.1 Available Commands

Click on a command in the list to copy it to the clipboard. The most important commands:

```
Start script: {"script": "my_script_name"} Trigger event: {"event": "follow"}
Event with input: {"event": "shoutout", "input": "username"}
Start playlist: {"playlist": "start"} Stop playlist: {"playlist": "stop"}
Play overlay: {"overlay": "overlay_name"}
Start Photo Mode: {"photo": "start", "user": "username"}
Trigger photo: {"photo": "snap"}
```

11.2 Stream Deck Integration

The "Web Requests" Stream Deck plugin lets you map ASTO-BOT commands to Stream Deck buttons:

Stream Deck Web Requests Plugin — connecting to ASTO-BOT via WebSocket

- Download the "Web Requests" plugin from the Stream Deck Store
- Create a new button of type "WebSocket Message"
- URL: ws://127.0.0.1:2519
- Message: The desired JSON command, e.g. {"playlist": "start"}

12. Settings — Further Settings

12.1 About & Community

The About tab with version, license, and Discord link

In the About tab you will find the current version, license information, and the "Join Apollo's Discord Server" button to join the community. There you can get help, suggest features, and stay up to date on updates.

12.2 Additional Settings Areas

- SpeakerBot: Connection to SpeakerBot for Text-to-Speech in chat
- Sounds: Management of the sounds folder
- System Check: Checks whether all dependencies are correctly installed
- Queues: Management of action queues for multiple events
- Variables: Display and management of global script variables
- Import/Export: Export your events, commands, and scripts as a backup or import configurations

13. Frequently Asked Questions (FAQ)

Why is the AI not responding?

- Check whether an API key has been entered (Settings → AI)
- Click the Test button to test the connection
- Make sure your Twitch account is connected (red = not connected)

OBS scenes are not switching?

- Make sure OBS is open and the WebSocket feature is enabled
- Check the URL and password in Settings → OBS and click Test
- The scene name must match exactly with the name in OBS (case-sensitive!)

The overlay is not showing in OBS?

- For the browser source: Check whether ASTO-BOT is running and the URL `http://127.0.0.1:2520/...` is correct
- For window capture: The "ASTO Overlay" window must be open (not ASTO-BOT 1.0)
- Capture method must be set to "Windows 10 (1903 and above)"

My script runs but %OBSScene% does not change?

- %OBSScene% is read live from OBS on every access — OBS must be connected

Channel Points cannot be refunded?

- Rewards must have been created through ASTO-BOT (Settings → Twitch → Rewards)
- Rewards created directly on Twitch.tv do not support automatic refunds

Where is my data stored?

- All configuration files are located in the Config folder next to the ASTO-BOT EXE
- Tokens and passwords are stored encrypted in Config/asto_secure.bin
- Scripts are located in the Scripts/ folder
- Overlays are in the Overlays/ folder
- Custom sounds are in the Sounds/ folder

How can I back up ASTO-BOT?

Go to Settings and click "Backup". An archive of all configuration files is immediately created. Use "Load Backup" to restore a previous state.
